

ABSTRACT

A registration system associates a customer, such as by a personal identifier, with a data record relating to a particular facility at a particular property or location, or other premises and issues an access card containing an access identifier for such particular facility. The access card includes a memory to which data such as the access identifier may be written and from which data such as the personal identifier may be read, such as by an electronic lock or other access control device. The registration system cooperates with a property management system for the property and, alternatively, may also cooperate with a personnel management system.
